

Mirage *The Range*

MOTIVATION

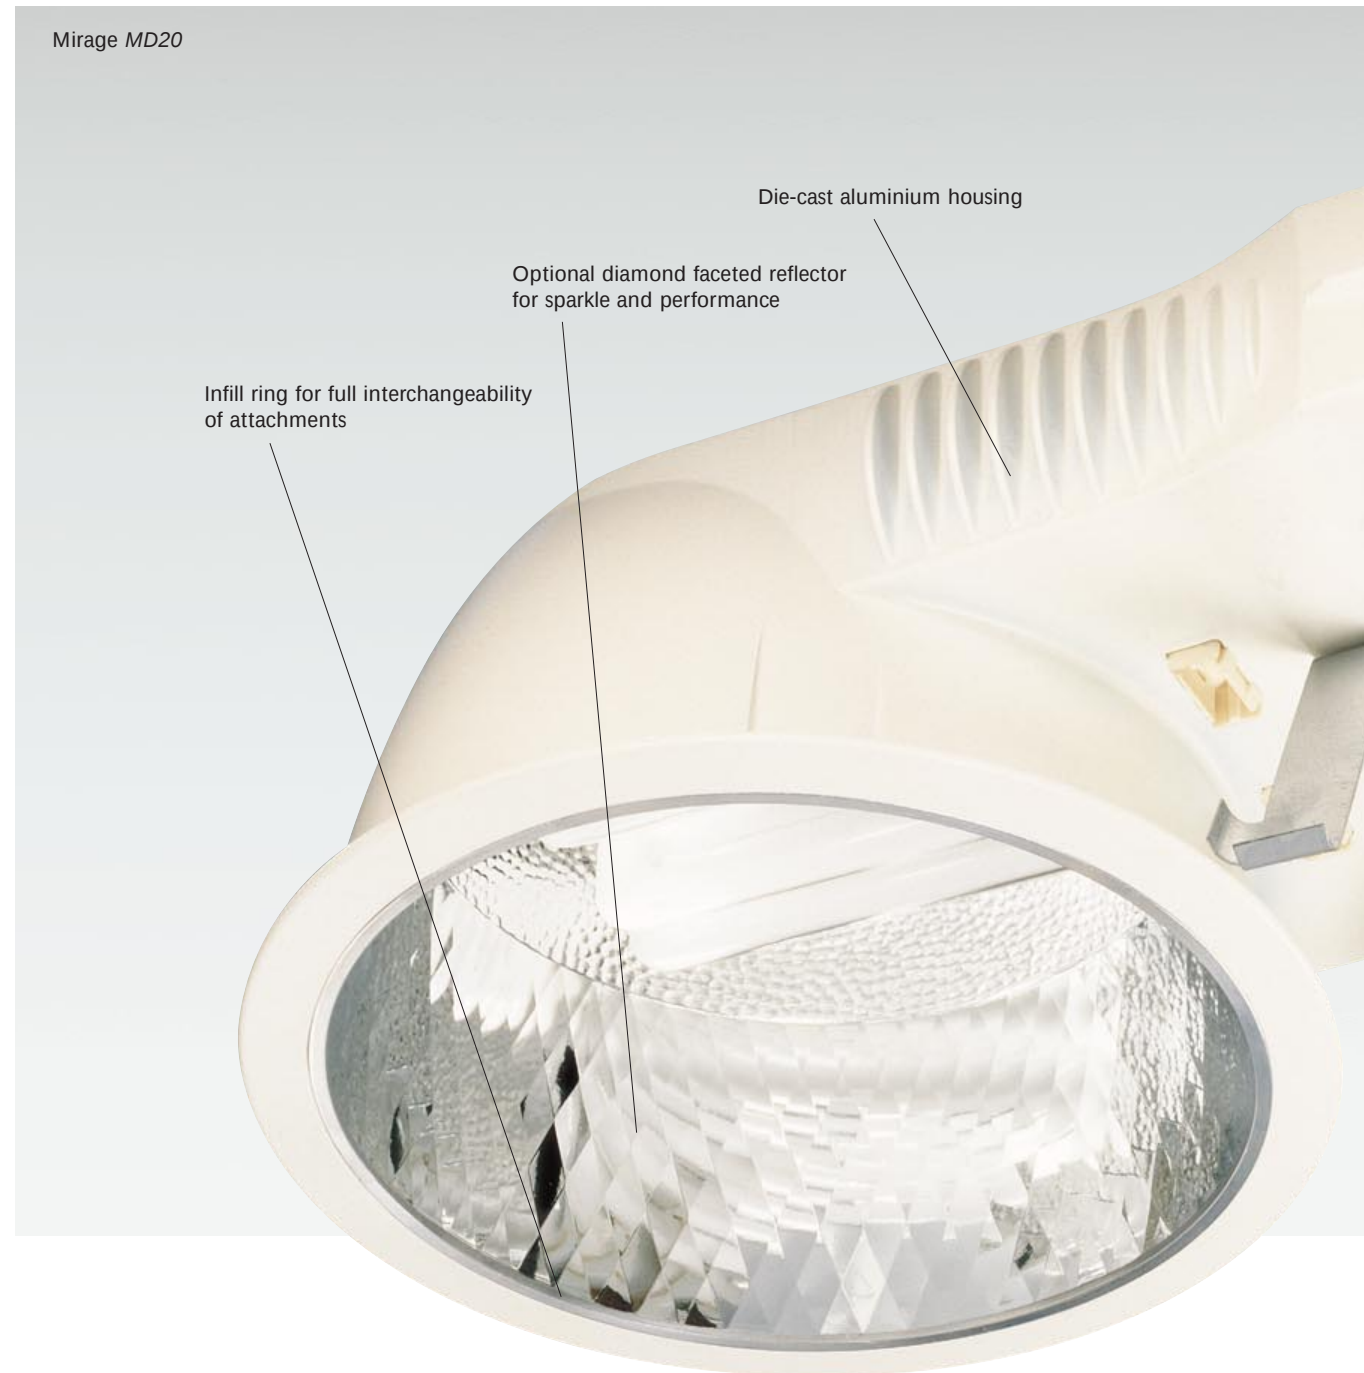

Mirage luminaires and their inter-changeable attachments – including diamond-faceted reflectors, spiral louvres, and suspended glass rings in colours and patterns – offer the creative downlighting effects your imagination visualised but existing product ranges could not deliver.

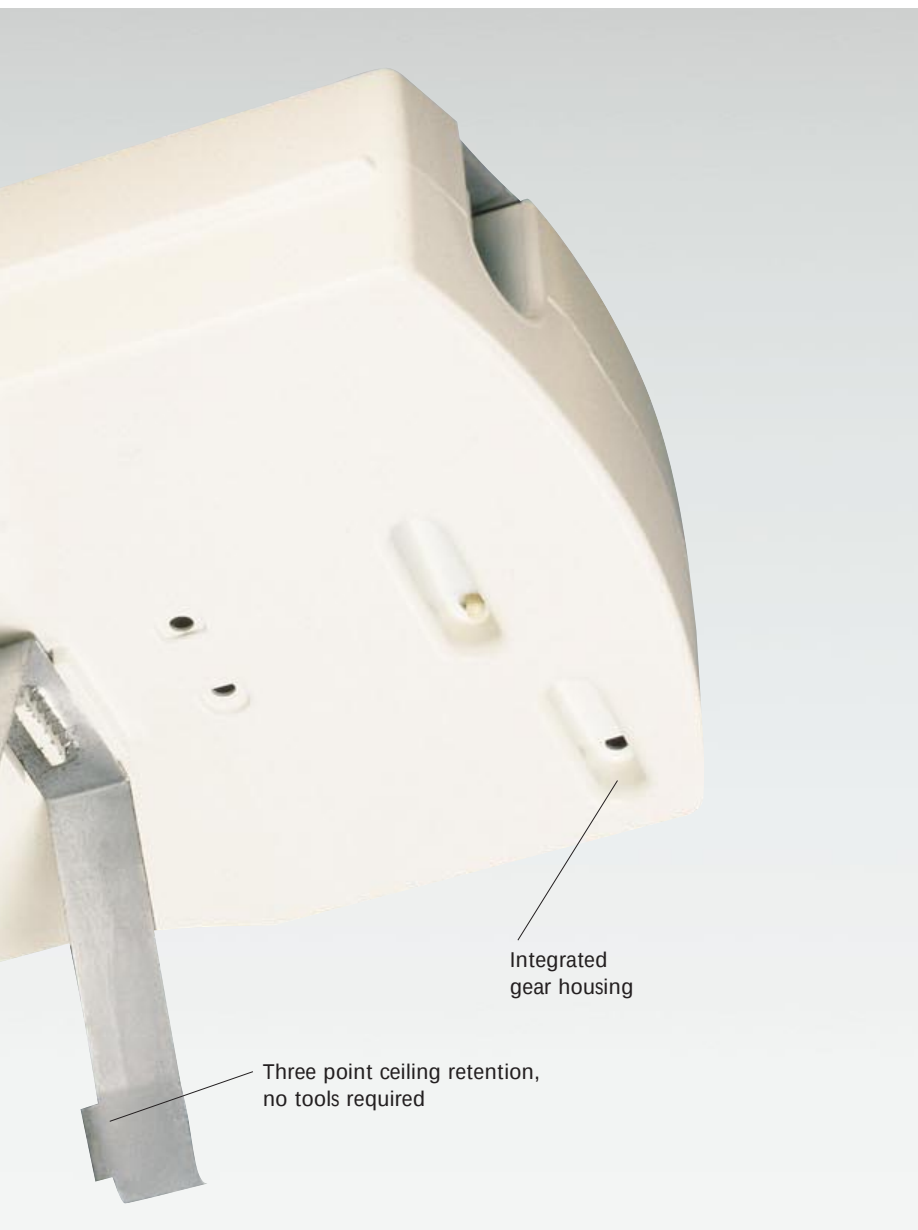

Mirage is a concise range of circular fluorescent downlighters – which, in combination with various interchangeable attachments – offer an amazing spectrum of effects in a variety of environments. Combining low energy with high style, the Mirage range was developed in consultation with architects, designers, and specifiers. Many were keen to find something new in downlighting – something more exciting and versatile, but in a compact, easy-to-use format.

The result is a family of luminaires: the horizontally-lamped **MD20** with an integrated gear housing, the larger **MD24**, and the vertically-lamped **MDD24 directional downlighter**. All three make clever use of attachments, for special – or even spectacular – effects, all of which are interchangeable to allow complete flexibility.

Each product is designed and built for quality, reliability, low maintenance, and ease of installation into a variety of ceiling types. Changing the attachments is easily achieved.

Mirage MD20

Top section showing tilted terminal block and labyrinth cable strain relief to ease installation.

Due to its horizontal lamping and compact integrated housing, the depth of the Mirage MD20 is just 112mm. This allows it to be sited in ceiling voids otherwise considered too restrictive for fluorescent downlighters.
