Cylinder Ring Satin Sides

Overview

To complement the Mirage LED downlighter, there are a range of architectural attachments. The range consists of five different feature rings, each developed to provide a subtle aesthetic enhancement to the standard luminaire. These feature attachments can be further enhanced by the addition of coloured rings, along with clear or opal inserts, to provide a staggering combination of options.

Easy Installation
The feature attachments simply clip into the Mirage LED bezel from the front face, and do not require tools to install. This means that they can be fitted at any time during or after installation, or even retro-fitted to existing luminaires.

Visual Integraton
The attachments can be mixed and matched throughout the building to offer visual zoning and architectural integration. The additional use of coloured inserts can help with navigation throughout a building by differentiating between areas, as well as just adding visual interest.

Glare Control
All feature attachments employ the same micro-polymer materials first used in our successful DUO2 range of luminaires and provide excellent light output ratios. The feature attachments also create an Intermediate Brightness Zone between ceiling and optic, which leads to greater visual comfort.
